Question for IBM cluster

Patomporn (Jab)
DQM-DC, Summer Student

Customize my own env

- I tried to >> conda create -n envMyown

- The result is

```
[-bash-4.2$ conda create -n envCMSDC python=3.6

NotWritableError: The current user does not have write permissions to a required path.
  path: /afs/cern.ch/user/p/ppayoung/.conda/pkgs/urls.txt
  uid: 125401
  gid: 1399

If you feel that permissions on this path are set incorrectly, you can manually
change them by executing

  $ sudo chown 125401:1399 /afs/cern.ch/user/p/ppayoung/.conda/pkgs/urls.txt

In general, it's not advisable to use 'sudo conda'.
```

- What I suppose to do to fix it ?

- btw, some slide might contains this then I would be appreciate it if you could provide

Running Job in Background

- I asking in advance if there is some case that our model takes too long to train then if I want to leave terminal

  - Is there any suggested way ? (e.g. nohup or other thing that robust)
